

Multi-Vendor Marketplace Admin Panel

The Multi-Vendor Marketplace Admin Panel is a front-end web application developed using HTML, CSS, and JavaScript. The project is designed to demonstrate the structure and functionality of an admin dashboard used in online marketplaces where multiple vendors sell products through a single platform.

The application provides a user-friendly and visually organized interface containing different sections such as Dashboard Overview, Vendors, Products, Orders, Customers, and Approvals. It presents sample information using cards, tables, and charts to display important details like total revenue, order statistics, customer data, and vendor activities.

This project mainly focuses on user interface design and basic front-end interactivity. Users can navigate between different modules, filter displayed information, and perform simple actions such as approving vendors, managing products, and adding new entries through forms. The data used in the application is static and intended only for demonstration and learning purposes.

The admin panel is designed with responsive layouts to ensure proper viewing on desktops, tablets, and mobile devices. By using front-end technologies, the project demonstrates how modern web applications can provide an interactive and organized management system.

The primary objective of this project is to help students understand the design and implementation of an e-commerce admin dashboard to create responsive and interactive web applications.

Overall, this project acts as a basic model for developing a marketplace administration interface with essential dashboard features.
